Zou Chenyang

Calling Google Map API, the program can realize the transformation of Singapore zip code, address name and latitude/longitude coordinates (you can input more than one at the same time). Google Map API calls the real-time four transportation modes in Singapore: driving, transit, bicycling, walking, to get the commuting distance of the four modes as well as the commuting time. Considering the four modes of transportation, output the maximum and minimum values of the total emissions. (If input provides the transportation mode of each person, then output the specific emissions) Calculate the GHG emissions based on an emission factor corresponding to each of the four modes.
